

# Test Your Knowledge 6

Let's take a small quiz!

We'll cover the following

- Quiz on Functions

## Quiz on Functions #

This Quiz will take maximum 10 minutes.

A function is a set of statements organized together so that they are executed separately.

Everything in R is a function.

An R function is created by using the keyword `function` .

It is compulsory to provide **arguments** to a function.

There are built-in R functions that we can use in user-defined functions.

We cannot use a `while()` loop in a function.

The value returned from a function must be a string.

The value of the last evaluated expression is returned automatically in R language.

Reserved words in R language can be used as identifiers as well.

We can create one function in another, and also call it in the same function.

---

In the next chapter, we will be learning how to use external inputs and outputting data in various forms.
