

Challenge: Formatting Strings

Test yourself and implement what you have learned so far in this challenge.

We'll cover the following

- Problem Statement
 - Input
 - Output
 - Sample Input
 - Sample Output
 - Test Yourself

Problem Statement

You are given a variable `quotient` which stores the quotient of two numbers. You have to print the result of the quotient in such a way that the output only shows the quotient up to 3 decimal places.

Input

The input is the variable `quotient`.

`quotient` has already been declared for you.

Output

The output will be the formatted quotient embedded in a string.

Sample Input

```
7 / 3
```

Sample Output

```
"The quotient is 2.333"
```

Test Yourself

Write your code in the given area. Try the exercise by yourself first, but if you get stuck, the solution has been provided. Good luck!

This code requires the following environment variables to execute: ^

LANG

C.UTF-8

```
// Write your code here
```

Hint 1 of 1

< Try using the f string interpolator.

Let's go over the solution review in the next lesson.
