

1.12 Aircon and Heating Controls

We monitor the temperature and change the `heating` to `aircon` when it is more than 20 degrees, and `heating` when it is below 20 degrees.

First create a directory `src/components/TeslaClimate`, create a `TeslaClimate.js` file in it, and enter the following code:

```
import React from 'react';
import PropTypes from 'react';
import './TeslaClimate.css';
const TeslaClimate = (props) => (
  <div className="tesla-climate">
    <label
      className={ 'tesla-climate__item ${props.value ? 'tesla-climate__item--active' : '' } ${!props.value ? 'tesla-climate__item--inactive' : ''} }
    >
      <p>{props.limit ? 'ac' : 'heat'} {props.value ? 'on' : 'off'}</p>
      <i className="tesla-climate__icon"></i>
      <input
        type="checkbox"
        name="climate"
        checked={props.value}
        onChange={() => {props.handleChangeClimate()}}
      />
    </label>
  </div>
);
TeslaClimate.propTypes = {
  value: PropTypes.bool,
  limit: PropTypes.bool,
  handleChangeClimate: PropTypes.func
}
export default TeslaClimate;
```

This component changes the style class according to the `props.value` passed in, and changes the text according to `props.limit`.

`TeslaBattery` passes callback(`handleChangeClimate` in this case) to `TeslaClimate`, which is executed whenever the state needs to be updated. `onChange` event can be used to notify the event. The callback passed by `TeslaBattery` is called with `setState()` to update its state and re-render.

1.12.1 TeslaClimate Component Style

Create a `TeslaClimate.css` file in the `src/components/TeslaClimate` directory and specify the following styles. Since the code is long and omitted here, let's check the

specify the following styles. Since the code is long and omitted here, let's check the [source code](#).

```
.tesla-climate {
  float: left;
}
.tesla-climate__item {
  cursor: pointer;
  display: block;
  width: 100px;
  height: 100px;
  border: 6px solid #f7f7f7;
  border-radius: 50%;
  box-shadow: 0px 1px 3px rgba(0, 0, 0, 0.3);
  color: #666;
  background: #fff;
}
...
```

1.12.2 Import TeslaClimate Component in TeslaBattery Container

Now we will implement `callback` in `TeslaBattery` and pass it to the `TeslaClimate` component.

First, add import to use the `TeslaClimate` component in `TeslaBattery.js`. We implement callback function `handleChangeClimate()` and bind it in `constructor()`. Then pass the callback function to the `TeslaClimate` component as `props`.

```
...
import TeslaClimate from '../components/TeslaClimate';
...
constructor(props) {
  super(props);
  ...
  this.handleChangeClimate = this.handleChangeClimate.bind(this);
  ...
}
// handle aircon & heating click event handler
handleChangeClimate() {
  const config = {...this.state.config};
  config['climate'] = !this.state.config.climate;
  this.setState({ config });
}
...
<TeslaClimate
  value={this.state.config.climate}
  limit={this.state.config.temperature > 10}
  handleChangeClimate={this.handleChangeClimate}
/>
...
```

Now the state value changes according to the temperature change, and when the

changed value is passed to the `TeslaClimate` component, the style class and text are changed according to the value.
