

Exercise 5: Data Frames

Let's test your understanding of data frames.

We'll cover the following ^

- Problem Statement
- Sample Output
- Test Yourself

Problem Statement

Create a student's semester record. This record should include the courses the student took, their grade, and the number of lectures that student attended for that particular course.

For reference look at the figure below:

Course	Lectures Taken	Grade
Maths	12	F
English	49	B
Science	52	A

Your task is to replicate this record using data frames.

Use `print()` for printing the data frame; else the test cases will not pass.

Sample Output

```
Course LecturesTaken Grade
```

Course LecturesTaken Grade

1	Maths	12	F
2	English	49	B
3	Science	52	A

Test Yourself

Write your code in the given area. If you get stuck, you can look at the solution.

```
# Write your code here  
print("")
```

In the next lesson, we give the solution review of this exercise.
