

Exercise: Play Around With cout Statement

In this exercise, you will try printing multiple objects using the cout statement

We'll cover the following

- Try Yourself

Try Yourself

Print this line using `cout`:

The movie quote is: My name is Bond. James Bond!

Output

Important Note: When you write the above line make sure there is only a single space between each word and no space between `is:`. Otherwise, your code won't pass the test case.

It would be better if you try using the `cout` statement by yourself first and then see the solution.

```
#include <iostream>
using namespace std;

void print(int n){
    //write your code here
    cout << " " <<endl;
}
```
