

Testing Top-Level Functions

We'll cover the following ^

- Top-level functions
- Test for returning a list
- Testing with mock

Top-level functions

The `Airport` class we designed using tests has the facility to return the information about a single airport and to sort a list of airports by name. We need a function that will take a list of airport codes and return a sorted list of airport information. We'll implement that function in a new `AirportStatus.kt` file, as a top-level function rather than as a method of a class. It turns out testing a top-level function isn't any different than testing a method of a class, as we'll see soon.

Test for returning a list

In the spirit of growing code incrementally using tests, let's first implement a simple, synchronous version of a `getAirportStatus()` function that takes a list of airport codes and returns a sorted list of `Airport` instances filled with information about each relevant airport. Let's look at the test first.

We'll use the first test to tease out the signature of the method `getAirportStatus()`—it should take a list of airport codes and return a list of `Airports`. Very quickly we'll need a few more tests for different combinations of airport codes. When writing the first test, we'll prepare for that by writing a data-driven test. Let's create a file named `AirportStatusTest.kt` under the `src/test/kotlin/com/agiledeveloper/airportstatus` directory with the following code:

```
package com.agiledeveloper.airportstatus
```

```
import io.kotlintest.specs.StringSpec
```

```
import io.kotlintest.shouldBe
```

```

import io.kotlintest.data.forall
import io.kotlintest.tables.row
import io.kotlintest.TestCase
import io.kotlintest.TestResult
import io.mockk.*

class AirportStatusTest : StringSpec() {
    init {
        "getAirportStatus returns status for airports in sorted order" {
            forall(
                row(listOf<String>(), listOf<Airport>())
            ) { input, result ->
                getAirportStatus(input) shouldBe result
            }
        }
    }
}

```

AirportStatusTest.kt

In the test, within the argument passed to the `forall` function, we define a pair of input and expected output using the `row()` function. Then in the lambda attached to `forall` we invoke the function under test, pass the first value from the row, and expect the result to be the second value from the row. Right now, the only expectation we have for the `getAirportStatus()` function is that it takes a list of `String` and returns an empty list of `Airports`. Let's get that implementation in place. To pass this test, create a file named `AirportStatus.kt` under the directory `src/main/kotlin/com/agiledeveloper/airportstatus` and add the following code:

```

// AirportStatus.kt
package com.agiledeveloper.airportstatus

fun getAirportStatus(airportCodes: List<String>): List<Airport> = listOf()

```

Run the tests and verify that all tests pass.

```

Testing with mock

Next, we'll add another row to the test, with one airport code in the input list of airport codes and an expected `Airport` information.

```
forall(
    row(listOf<String>(), listOf<Airport>()),
    row(listOf("IAD"), listOf(iad))
) { input, result ->
    getAirportStatus(input) shouldBe result
}
```

AirportStatusTest.kt

Two issues arise in running this test. First, we need to define the reference `iad` provided in the second row. Second, to make this test to pass, if we change `getAirportStatus()` so that it calls `Airport.getAirportData()`, the test will fail since the latter function calls `fetchData()`, which isn't implemented yet. To keep our focus on the design and implementation of `getAirportStatus()` we'll mock the `Airport.getAirportData()` function, in the `AirportStatusTest` class, like so:

```
val iad = Airport("IAD", "Dulles", true)
val iah = Airport("IAH", "Houston", false)
val inv = Airport("inv", "Invalid Airport", false)

override fun beforeTest(testCase: TestCase) {
    mockkObject(Airport)
    every { Airport.getAirportData("IAD") } returns iad
    every { Airport.getAirportData("IAH") } returns iah
    every { Airport.getAirportData("inv") } returns inv
}

override fun afterTest(testCase: TestCase, result: TestResult) {
    clearAllMocks()
}
```

AirportStatusTest.kt

We've defined three fields in the test, each referring to canned airport information. Within the `every()` functions, we instruct the mock for `Airport` to return the appropriate canned value based on the airport code passed to the `Airport.getAirportData()` function.

To make the test pass, edit the `getAirportStatus()` function to return a list of `Airport` for the given list of airport codes.

```
// AirportStatus.kt
fun getAirportStatus(airportCodes: List<String>): List<Airport> =
    airportCodes.map { code -> Airport.getAirportData(code) }
```

Run the tests and verify that all tests pass.

```

```

Using the `map()` function, we iterate over each element in the input `airportCodes` collection and create a list of `Airport` instances returned by the `getAirportData()` function.

Let's add a few more rows of test data, where the rows we'll add will expect the result from `getAirportStatus()` to be in sorted order by name of the airport.

```

forall(
    row(listOf<String>(), listOf<Airport>()),
    row(listOf("IAD"), listOf(iad)),
    row(listOf("IAD", "IAH"), listOf(iad, iah)),
    row(listOf("IAH", "IAD"), listOf(iad, iah)),
    row(listOf("inv", "IAD", "IAH"), listOf(iad, iah, inv))
) { input, result ->
    getAirportStatus(input) shouldBe result
}

```

AirportStatusTest.kt

To make the modified test pass, we'll pass the result of the call to `map()` through the `Airport.sort()` function.

```

// AirportStatus.kt
fun getAirportStatus(airportCodes: List<String>): List<Airport> =

```

```
