

Solution Review: Initialize a Variable and Overwrite its Value

Let's see the detailed solution review of the challenge given in the previous lesson.

We'll cover the following ^

- Solution
- Explanation

Solution

```
#include <iostream>

using namespace std;

int main() {
    // Initialize variable var to 5000
    int var = 5000;
    // Prints value of var
    cout << "var = " << var << endl;
    // Overwrite value of var to 1000
    var = 1000;
    // Prints new value of var
    cout << "var = " << var << endl;
}
```

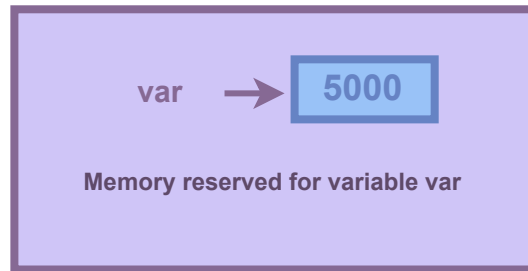

Variable initialization and declaration

Explanation

Line No. 7: Initializes a variable `var` to `5000`

variable_datatype ← int var = 5000 ; → variable_value
variable_name Assign value to variable

RAM

Line No. 9: Displays the value of `var`

Line No. 11: Overwrites the value of `var` to `1000`

RAM

Line No. 13: Displays the updated value of `var`

Let's solve a slightly more difficult challenge in the upcoming lesson.
