

Challenge: Make Variables

Declare variables in PHP and assign values to them.

We'll cover the following ^

- Problem Statement
- Output
- Coding Exercise

Problem Statement

- Declare an *int* type variable and name it `$intNumber` and assign it a value of **1000**.
- Declare a *char* type variable and name it `$charName` and *assign* it a value of **N**.
- Declare a *boolean* type variable and name it `$boolAccept` and *assign* it a value of **true**.
- Declare a *float* type variable and name it `$floatNum` and *assign* it a value of **10.292**.

Now output these values on the console using the `echo` function in PHP. The values should be separated by a comma.

Output

```
1000, N, 1, 10.292
```

Coding Exercise

```
echo "write your code here"; //comment out this line before testing your code
// don't worry about the php tags
```

Now that you know about variables and data types, let's learn about operators in the next chapter.
