

Challenge: Using Multiple Operators

Test yourself and implement what you have learned so far in this challenge.

We'll cover the following ^

- Problem Statement
 - Input
 - Output
 - Sample Input
 - Sample Output
 - Test Yourself

Problem Statement

You are given a variable `check` which stores an integer value. You have to create a variable `compareCheck` which checks if the value stored in `check` is less than 75 and greater than or equal to 8. The result should be `true` if it is between 8 and 75 and `false` if it isn't.

Input

The input is the variable `check`.

`check` has already been declared for you.

Output

The output will be the value assigned to `compareCheck`.

Sample Input

3

Sample Output

false

Test Yourself

Write your code in the given area. Try the exercise by yourself first, but if you get stuck, the solution has been provided. Good luck!

This code requires the following environment variables to execute:

LANG

C.UTF-8

```
// Rewrite compareCheck  
  
val compareCheck = "temp"
```

Let's go over the solution review in the next lesson.
