

Challenge: Type Casting

Test yourself and implement what you have learned so far in this challenge.

We'll cover the following ^

- Problem Statement
 - Input
 - Output
 - Sample Input
 - Sample Output
 - Test Yourself

Problem Statement

In this challenge, your task is to convert the data type of an already existing variable using type casting. You are provided with a variable `oldType` of type `Float` which needs to be type cast to `Double`.

Input

The input is the variable `oldType`.

`oldType` has already been declared for you.

Output

The output will be the value assigned to `newType`.

Sample Input

45F

Sample Output

45D

Test Yourself

Write your code in the given area. Try the exercise by yourself first, but if you get stuck, the solution has been provided. Good luck!

This code requires the following environment variables to execute:

LANG

C.UTF-8

```
// Rewrite newType  
val newType: String = "temp"
```

Let's go over the solution review in the next lesson.
