

Solution Review: Embed a Variable in a String

In the following lesson, we will go over the solution of the challenge: Embed a Variable in a String.

We'll cover the following ^

- Task
- Solution

Task

In this challenge, you were provided two variables and you had to embed them in a string.

Solution

The first thing you had to figure out, was that the `s` string interpolator can be used to embed variables into strings.

```
print(s.....)
```

Next, you needed to write the required string in a print statement. To embed `name` and `age` in the string you had to insert a `$` followed by the variable name at the location where you wanted to embed the variables.

```
print(s"$name is $age years old.")
```

You can find the complete solution below:

You were required to write the code on **line 4**.

This code requires the following environment variables to execute: ^

LANG C.UTF-8

```
val name = "Ben"
val age = 18
```

```
val age = 18
```

```
print(s"$name is $age years old.")
```

Now let's move on to string interpolation with `f` in the next lesson.
