# DELETE Method

In this lesson, we will learn about the HTTP Delete method.

What is the DELETE method?

The `HTTP` `DELETE` method deletes the specified resource on the server.

`DELETE` is **idempotent**, which means that an outcome will remain the same even if it's called several times successively with the same request data.

Let's make a `DELETE` request for the given `URL`.

```
curl -iX DELETE https://reqres.in/api/users/2
```

Here, we are trying to delete the user (id = 2).

● Terminal	⟳ ⌃

Understanding the terminal output

- The response of `DELETE` request is empty { } `JSON` which means that the resource is deleted and the `HTTP` response status code is `204 OK`.

Please refer to this link to learn more about `HTTP` Methods.

Let's go through a quick quiz to test your understanding of HTTP methods.
